Introduction

Powerwise can reduce energy usage, help save the environment, and save you money. Powerwise does this by ensuring your computers are in the correct power state at any time of the day or night.

Powerwise will automatically turn on your computers when they are required by learning when a computer is turned on each day, and will then ensure the computers are powered down later based on inactivity and/or time of day and day of the week.

To begin benefitting from Powerwise you will need to follow these three simple steps:

- 1 Install Powerwise on your server.
- 2 Configure your Powerwise Profiles.
- 3 Install the Powerwise Agent on the computers you want to manage.

Who is the guide for

This document is intended as a guide to assist administrators with the installation of Powerwise. Once the server is installed you will also need the Powerwise User Guide. It is assumed that readers of this guide will have a good basic knowledge of Microsoft Operating Systems (both server and workstation), and PC power management.

Before you begin

Before you start ensure you have the following:

- Powerwise software
- A license key
- Computer on which to install Powerwise Server
- Admin rights to install the software

Requirements

Powerwise is made up of three components; the Server, Console, and Agent, and has been designed as a low impact, small foot print solution. There are no specific hardware requirements for installing Powerwise, assuming at least the recommended specification for each of the supported operating systems is met.

The Server

The Powerwise Server is the hub of the system, holding various configuration data, storing power usage statistics, and managing the communications between the Server and Agents. The Powerwise Server runs as a Windows service and is supported on Microsoft Windows Server 2003 and 2008 versions.

The Powerwise Console provides the administration interface for Powerwise. The Console provides two levels of access, User and Administrator. User access provides access to day to day management such as configuring Powerwise Profiles, and running tasks, whilst Administrator access adds the additional features of license and connection management.

The Console is installed on the Powerwise server as part of the default installation, however it can be installed and/or run from anywhere on the network.

Workstation

The Powerwise Agent must be installed on each computer where you want to control power management. There is no user interface other than configuration through a Control Panel applet. The Powerwise Agent runs as a Windows service and can be installed on the following workstation operating systems:

- Microsoft Windows 7
- Microsoft Windows Vista
- Microsoft Windows XP
- Microsoft Windows 2000 (SP4)

In order for Agent computers to 'wakeup' their BIOS must support and be configured to use either Wake-On-LAN or Intel vPro.

Security

It is recommended that Powerwise is installed on a server within an Active Directory environment in order to take advantage of the integrated security. Powerwise will, however function perfectly well in a workgroup environment. If you wish to take advantage of the integrated security you will need to decide before installation, as the installation process automatically creates a domain service account for Powerwise.

Installing Powerwise Server

You will need to be logged on to your selected Powerwise server machine with Domain Admin main privileges, or with a local administrator account if installing on a standalone server (Workgroup).

- 1 If you are running the installation from media then follow the autorun menu to start the Powerwise server installation. If you have downloaded Powerwise then copy PowerwiseSetup.exe to the server and run it.
- 2 The Server Installation Wizard will start. Click **Next** and then review and accept the License agreement before clicking **Next** to continue.

3 You will now have to enter the License Key. If you downloaded Powerwise the key will have been emailed to you. If you have box product then you will find the License Key located on the back page of the Powerwise User Guide. Click **Next** to continue.

🔡 Powerwise - Server Setup	- • •
License Key Enter your supplied license key	ltı.
The license key is not case sensitive.	
	<pre></pre>

4 If required you can now change the folder where Powerwise will be installed. Once you have changed it, or left the default click on **Install Now**.

(
閿 Powerwise - Server Setup	
Destination Folder	8.
Select a folder where the server will be installed.	llt.
The Powerwise - Server Wizard will install the files in the following folder.	
Press Install Now to accept all default options, or next to customise the ins	tallation.
Destination Folder	
C:\Program Files\Modus\Powerwise\Server\	Browse
Install Now	
<pre></pre>	Cancel

5 The Powerwise installation will now run. After a short period of time the License Activation will start. This connects to the modus license activation system over the internet.

If the activation fails skip to the next section; Web Activation

If Powerwise fails to contact the activation server, you can use the Web Activate process. If during the server installation your license activation was successful then skip this section.

1 When you get an error dialog similar to the one below click on **Web Activate**.

2 A key string will then be generated which you will need to copy to the clipboard or to a notepad file.

Si License Activation	X

< Back Next > Canc	el

- 3 Once you have copied the key string **click on the URL link**. Do **NOT** press **Next** at this time.
- 4 Your browser will connect to modus and start the Web Activate process.
- 5 Within your browser click **Next** on the Welcome Page.
- 6 At the License Key page you will need to paste in the key string you copied in step 2 and then click on **Next**.
- 7 As the original activation failed you will need to click on **Back** on the Error page.
- 8 Complete each field on the Registration details page and click on Next..
- 9 You will now see the Complete page with another key string. Please copy this key string to the clipboard or to a notepad file and close the browser.
- 10 Go back to the License Activation wizard and click on **Next**.
- 11 You will now be prompted to paste the new activation key string into the dialog as shown below. You can then click on **Next**.

- 12 The License Activation process is now complete.
- 13 .
- 14 You will now be prompted to complete your registration details then click Next.
- 15 Click **Finish** to complete the License Activation.
- 16 The installation will complete and the Powerwise Management Console will now load.
- 17 The Powerwise Server Installation wizard is now complete and you can switch to it and click on **Finish**.

You can now skip the next section.

Web Activation

If Powerwise fails to contact the activation server, you can use the Web Activate process. If during the server installation your license activation was successful then skip this section.

18 When you get an error dialog similar to the one below click on Web Activate.

19 A key string will then be generated which you will need to copy to the clipboard or to a notepad file.

- 20 Once you have copied the key string **click on the URL link**. Do **<u>NOT</u>** press **Next** at this time.
- 21 Your browser will connect to modus and start the Web Activate process.
- 22 Within your browser click **Next** on the Welcome Page.
- 23 At the License Key page you will need to paste in the key string you copied in step 2 and then click on **Next**.
- 24 As the original activation failed you will need to click on **Back** on the Error page.
- 25 Complete each field on the Registration details page and click on Next..
- 26 You will now see the Complete page with another key string. Please copy this key string to the clipboard or to a notepad file and close the browser.
- 27 Go back to the License Activation wizard and click on Next.
- 28 You will now be prompted to paste the new activation key string into the dialog as shown below. You can then click on **Next**.

29 The License Activation process is now complete.

If you cannot use a browser from your server then you can activate the license after the installation is complete; you have 3 days to do this. To activate the license key after the server installation, see the Advanced Management and Configuration section in the Powerwise User Guide.

Installing the Powerwise Agent

In order for a computer to be controlled by Powerwise the Agent must be installed. Once the Agent is installed it will immediately attempt to connect to the server. By default the server will assign the 'Default' Powerwise Profile to any new 'Managed' computers. For more information on configuring and managing Powerwise Profiles please refer to the Powerwise User Guide.

There are several techniques which can be used for installing the Powerwise Agent throughout an organisation, from a web page driven manual installation, through to support for fully automated enterprise management tools.

Agent Installation from the web console

The use of the Powerwise web console to install the Agent is best suited to organisations with a small number of computers to be managed by Powerwise, and ad-hoc installations of the Agent.

- 1 On the target computer(s) login with a local admin account
- 2 Open a browser and go to the address http://<<servername>>:2248 (or just http://<<servername>> if you have enabled port 80 on the Powerwise server).
- 3 From the Powerwise web console click on Install Powerwise Agent
- 4 When prompted click on **Run**, and then click on **Run** again at the Security Warning dialog
- 5 Now follow the Agent Installation Wizard and click Next
- 6 Accept the License Agreement and click Next
- 7 Enter your server name and click Next
- 8 Click Next and the Agent will install
- 9 When the installation completes click on Finish
- 10 The Agent will automatically start and connect to the server. Load the Management Console to check that the computer is listed and shows as Online.

Agent Installation from the Console

As with the Web Console the installation from the Powerwise Console is best suited to organisations with a small number of computers or ad-hoc installations of the Agent.

- 1 Load the Powerwise Console as an administrator
- 2 Click on the Connections tile
- 3 Click on Install...
- 4 You can now either select a computer or computers using the network browse button or by inputting explicit computer names.

- 5 Once the computer or computers have been selected the wizard will check to see if the target devices are responding. Click **Next**
- 6 You can now specify the credentials to be used for the installation as well as amend the server connection information if required.
- 7 Click Next to initiate the installation(s).
- 8 You will see progress information for each selected computer as well as errors if generated.

Creating a tailored Windows Installer package

Powerwise can generate a Windows Installer Package ready for you to use in your application deployment tooling.

- 1 Load the Powerwise Console as an administrator
- 2 Click on the Connections tile
- 3 Click on **Download...**
- 4 Select the Agent x86 6.0.355.0 package and click Next
- 5 You will now be prompted to provide a path where you want the package files to be copied to. There is also a field to specify the server name the Agents should connect to.

당 Download Pac	kage	×			
Select package default settings					
Download package to the following folder:					
Path:	\\server1\packages	Browse			
Change default installation settings Attempt to connect to first discovered server					
Server Name:	Server 1				
Press 'Next' to download this package from the server					
	< Back Next >	Cancel			

6 Once complete, all the files needed to deploy the Agent via a Windows Installer based technique will be in the directory specified.
